AUSTRALIAN STANDARD
AS/CA S043.3:2015
Requirements for Customer Equipment for connection to a metallic local loop interface of a Telecommunications Network — Part 3: DC, low frequency AC and voiceband
Australian Standard – Requirements for Customer Equipment for connection to a metallic local loop interface of a Telecommunications Network — Part 3: DC, low frequency AC and voiceband

This Standard was issued in draft form for public comment as DR AS/CA S043.3:2014.
First published as AS/ACIF S043.3:2001
Second edition as AS/ACIF S043.3:2008
Third edition as AS/CA S043.3:2015
ISBN: 1 74000 434 5

Disclaimers

1. Notwithstanding anything contained in this Standard:

   (a) Communications Alliance disclaims responsibility (including where Communications Alliance or any of its officers, employees, agents or contractors has been negligent) for any direct or indirect loss, damage, claim, or liability any person may incur as a result of any:

      (i) reliance on or compliance with this Standard;

      (ii) inaccuracy or inappropriateness of this Standard; or

      (iii) inconsistency of this Standard with any law; and

   (b) Communications Alliance disclaims responsibility (including where Communications Alliance or any of its officers, employees, agents or contractors has been negligent) for ensuring compliance by any person with this Industry.

2. The above disclaimers will not apply to the extent they are inconsistent with any relevant legislation.

FOREWORD

General

This Standard was prepared by Communications Alliance and most recently revised by the WC58 : VDSL2 and Vectoring Working Committee. It is one of a series of Telecommunication Standards developed under the Memorandum of Understanding between the Australian Communications Authority (ACA) and the Australian Communications Industry Forum.

Note: On 1 July 2005 the ACA became the Australian Communications and Media Authority (ACMA) and the Memorandum of Understanding continues in effect as if the reference to the ACA were a reference to the ACMA.

Communications Alliance was formed in 2006 and continues the functions previously fulfilled by ACIF.

This Standard is a revision of AS/ACIF S043.3:2001 Requirements for Customer Equipment for connection to a metallic local loop interface of a Telecommunications Network — Part 3: DC, low frequency AC and voiceband Standard.

This Standard is the result of a consensus among representatives on the Communications Alliance Working Committee to produce it as an Australian Standard.

The requirements in this Standard are consistent with the aims of s376 of the Telecommunications Act 1997. Specifically these aims are:

- protecting the integrity of a telecommunications network or facility;
- protecting the health and safety of persons;
- ensuring access to emergency services; and
- ensuring interoperability with a standard telephone service.

It should be noted that some Customer Equipment (CE) may also need to comply with requirements in other Standards or other Parts of this Standard.

AS/CA S043 consists of the following parts under the general title Requirements for Customer Equipment for connection to a metallic local loop interface of a Telecommunications Network:

- Part 1: General
- Part 2: Broadband
- Part 3: DC, low frequency AC and voiceband

The Standard should be read in conjunction with AS/CA S043.1 [6].

Applicable electrical safety Standards and EMC Standards may apply under Commonwealth or State/Territory laws, or both.

Intellectual property rights

Equipment which is manufactured to comply with this Standard may require the use of technology which is protected by patent rights in Australia. Questions
about the availability of such technology, under licence or otherwise, should be
directed to the patent holder or Australian licensee (if known) or through enquiry
at IP Australia which incorporates the Patent, Designs and Trade Marks and
Offices. Further information can be found at www.ipaustralia.gov.au.

Standards revision

Australian Standards (AS/CA Standards) developed by the Communications
Alliance are updated according to the needs of the industry, by amendments or
revision. Users of these Standards should make sure that they possess the latest
amendments or editions. Representations concerning the need for a change to
this AS/CA Standard should be addressed to:

The Project Manager
Customer Equipment and Cable Reference Panel
Communications Alliance
PO Box 444
Milsons Point NSW 1565

Regulatory notice

This document will be submitted to ACMA, for making as a technical standard
under s376 of the Telecommunications Act 1997. Until it is made by ACMA
compliance with this Standard is voluntary.

The ACMA is a Commonwealth authority with statutory powers to impose
requirements concerning telecommunications Customer Equipment and
Customer Cabling.

The ACMA requires Australian manufacturers and importers, or their Australian
agents, of specified items of Customer Equipment and Customer Cabling to
establish compliance with Standards such as this. Items are required to be
labelled in accordance with the applicable labelling notices.

Details on current compliance arrangements can be obtained from the ACMA
website at http://www.acma.gov.au or by contacting the ACMA below at:

Introduction

This introduction for the AS/CA S043.3 Requirements for Customer Equipment for connection to a metallic local loop interface of a Telecommunications Network — Part 3: DC, low frequency AC and voiceband Standard is not an authoritative section of this Standard and is only provided as guidance for the user of the Standard to outline its objectives, and the factors that have been taken into account in its development and to list the principal differences between the new and the previous edition.

The reader is directed to the clauses of this Standard for the specific requirements and to the ACMA for the applicable telecommunications labelling and compliance arrangements.

Note: Further information on the telecommunications labelling and compliance arrangements can be found in The Telecommunications Labelling (Customer Equipment and Customer Cabling) Notice (the TLN). The TLN can be obtained from the ACMA website at www.acma.gov.au.

The objective of this Standard is to provide the requirements and test methods for customer equipment designed or intended for connection to a Telecommunications Network via a metallic local loop interface and is designed or intended to include one or more of the following:

(i) DC power feeding or signalling.

(ii) Operation in the low frequency AC band, below 300 Hz.

(iii) Operation in the voice frequency band.

(iv) Operation above the voice frequency band up to 20 kHz.

in order to meet the regulatory arrangements for such equipment in Australia.

The objective of this revision is to update to the current template at the same time that revisions were being made to other parts of AS/CA S043.

The principal differences between this edition of AS/CA S043.3 and the previous edition are:

(i) Editorial updates; and

(ii) Update to the current document template for Communications Alliance.

1 INTERPRETATIVE GUIDELINES

1.1 Categories of requirements

This Standard contains mandatory requirements as well as provisions that are recommendatory only. Mandatory requirements are designated by the words ‘shall’ or ‘shall not’. All other provisions are voluntary.

1.2 Compliance statements

Compliance statements, in italics, suggest methodologies for demonstrating CE’s compliance with the requirements.

1.3 Definitions, expressions and terms

If there is any conflict between the definitions used in this Standard and the definitions used in the Telecommunications Act 1997, the definitions in the Act take precedence.

1.4 Notes

Text denoted as ‘Note’ is for guidance in interpretation and is shown in smaller size type.

1.5 References

(a) Applicable editions (or versions) of other documents referred to in this Standard are specified in Section 3: REFERENCES.

(b) If a document refers to another document, the other document is a sub-referenced document.

(c) Where the edition (or version) of the sub-referenced document is uniquely identified in the reference document, then that edition (or version) applies.

(d) Where the edition (or version) of the sub-referenced document is not uniquely identified in the reference document, then the applicable edition (or version) is that which is current at the date the reference document is legislated under the applicable regulatory framework, or for a non-legislated document, the date upon which the document is published by the relevant standards organisation.

(e) A number in square brackets ‘[ ]’ refers to a document listed in Section 3: REFERENCES.

1.6 Units and symbols

In this Standard the International System [SI] of units and symbols is used in accordance with Australian Standard AS ISO 1000 [1].
1.7 **Parts of Standards**

CE scoped by this Standard is to comply with the applicable technology-specific Part(s) of this Standard.
2 SCOPE

2.1 This Standard applies to Customer Equipment (CE) that is designed or intended for connection to:

(a) is designed or intended for connection to a Telecommunications Network via a metallic local loop interface; and

(b) is designed or intended to include one or more of the following capabilities:

i. DC power feeding or signalling.

ii. Operation in the low frequency AC band, below 300 Hz.

iii. Operation in the voice frequency band.

iv. Operation above the voice frequency band up to 20 kHz.

2.2 CE is not excluded from the scope of this Standard by reason only that it is capable of performing functions additional to those described in this Standard.

Note: Requirements for CE designed or intended to interwork with the PSTN for DC loop seizure and clearing, low frequency AC ring signalling, and decadic or DTMF address signalling etc. are defined in AS/CA S002 [3].

4.2 Definitions

4.2.1 Customer Cabling

Refer to Section 20 of the Telecommunications Act 1997.

Note: This covers both internal and external cable of any type, e.g. metallic pair, screened metallic pair, coaxial or optic fibre.

4.2.2 Customer Equipment (CE)

Refer to Section 21 of the Telecommunications Act 1997.

4.2.3 Equipment Class

Refer to Clause 4.2.2 of AS/CA S043.2 [7].

4.2.4 Facility

Refer to Section 7 of the Telecommunications Act 1997.

4.2.5 Telecommunications Network

Refer to Section 7 of the Telecommunications Act 1997.

4.2.6 Voice Frequency (VF)

Those signals nominally confined to frequencies in the range of 300 Hz to 3.4 kHz.
4.2.7 Voiceband

Refer to Clause 4.2.6 for voice frequency (VF) signals.
5 REQUIREMENTS

5.1 DC signals

If CE can deliver DC signals, the CE is to comply with the following requirements:

(a) DC signals shall not exceed the TNV-3 limits specified in AS/NZS 60950.1 [2], when measured at the output terminals of the equipment on open circuit.

(b) When DC signals are reversed in polarity for signalling, telemetry or metering purposes, the resulting impulses measured with an instrument incorporating a filter in accordance with ITU-T Rec. O.71 [9] shall not exceed a threshold level of –32 dBm.

Note: These requirements align with ITU-T Rec. Q.45 bis [10] for impulse noise.

Compliance with Clause 5.1.1 should be checked by using the methods described in Clauses 6.3.1 and 6.3.2.

5.2 Low frequency AC signals

If CE can deliver AC signals below 300 Hz, the CE is to comply with the following requirements:

(a) AC signals up to 100 Hz delivered by the CE, including ringing signals, shall not exceed the TNV-3 limits specified in AS/NZS 60950.1 [2], when measured at the output terminals of the equipment on open circuit.

(b) Signals between 100 Hz and 200 Hz delivered by the CE shall not exceed 10 V r.m.s. at the output terminals of the equipment on open circuit.

(c) Signals between 200 Hz and 300 Hz delivered by the CE shall not exceed 5.0 V peak to peak at the output terminals of the CE on open circuit.

(d) Levels of noise and distortion products generated by CE are to comply with the following:

i. With the exception of ring signals, for all AC signals below 100 Hz, noise and harmonics of the signals shall not exceed 774 mV Psophometric when terminated with 600 Ω measured using a device compliant with ITU-T Rec. O.41 [8].

ii. For ring signals, the noise and harmonics of the ring signals shall not exceed 774 mV Psophometric when terminated with the following loads, being:

A. an open circuit; and
B. a 1 µF capacitor in series with a 4 kΩ resistor.

iii. For all signals between 100 Hz and 300 Hz, the peak power level of noise and distortion products above 3.4 kHz shall comply with the requirements of Clause 5.4.

(e) The power level of individual spectral components of any longitudinal component of the output signals shall not exceed the limits shown in Figure 2.

(f) AC currents delivered by the CE shall not exceed 100 mA under normal operating conditions.

Compliance with Clause 5.2 (b) and (c) should be checked by using the method described in Clause 6.3.4.1, without the 600 Ω termination.

Compliance with Clauses 5.2 (d)(i) and (ii) should be checked by using the method described in Clause 6.3.4.5.

Compliance with Clause 5.2 (d)(iii) should be checked by using the method described in Clause 6.3.4.4 with a termination of 600 Ω.

Compliance with Clause 5.2 (e) should be checked by using the method described in Clause 6.3.3.

Compliance with Clause 5.2 (f) should be checked by using an RMS reading ammeter.

5.3 Voiceband signals

5.3.1 The peak-to-peak level of signals transmitted to line shall not exceed 5.0 V when measured across a 600 Ω resistive termination.

Compliance with Clause 5.3.1 should be checked by using the method described in Clause 6.3.4.3.

5.3.2 The one-minute mean power level of signals transmitted to line within the frequency range 300 Hz to 3.4 kHz, except for speech and music, shall not exceed –10 dBm.

Compliance with Clause 5.3.2 should be checked by using the methods described in Clauses 6.3.4.1 and 6.3.4.2 with R in 6.3.4.1 set to 600 Ω.

5.3.3 The normal operating level of speech and music shall not exceed –6 VU.

Compliance with Clause 5.3.3 should be checked by using the methods described in Clauses 6.3.4.6.

5.4 Signals beyond 3.4 kHz

5.4.1 The power spectral density (PSD) of signals beyond 3.4 kHz shall not exceed:
(a) the limits in Figure 1 and Table A2 for CE complying with Equipment Class 3a; or

(b) the limits in Figure 1 and Table B2 for CE complying with Equipment Class 3b

when measured using a noise power bandwidth of 10 kHz.

Compliance with Clause 5.4.1 should be checked by using the methods described in Clauses 6.3.4.1 and 6.3.4.4 (a) with R in Clause 6.3.4.1 set to 135 Ω.

5.4.2 The PSD of signals between 300 kHz and 30.175 MHz shall be either:

(a) less than $-120$ dBm/Hz; or

(b) more than 10 dB below the PSD limit shown in Figure 1 (represented by the dashed line).

when measured as the total average power within a 1 MHz sliding window (1 MHz bandwidth) which is described in Table 1.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth of sliding window</td>
<td>1 MHz</td>
</tr>
<tr>
<td>Reference frequency</td>

<td>10 kHz</td>
</tr>
<tr>
<td>Start Frequency</td>
<td>300 kHz</td>
</tr>
<tr>
<td>Stop Frequency</td>
<td>29.175 MHz</td>
</tr>
</tbody>
</table>

Note 1: The Power Spectral Density requirements contained in Clause 5.4 are the same as in ANSI Standard T1.601 [11], and have been included to ensure spectral compatibility of CE with DSL CE.

Note 2: The purpose of the sliding window measurement is to ensure that CE does not generate noise up to the allowable limit across the entire band.

Compliance with Clause 5.4.2 should be checked by using the methods described in Clauses 6.3.4.1 and 6.3.4.4 (b) with R in 6.3.4.1 set to 135 Ω.

5.5 Longitudinal signals

The power level of individual spectral components of any longitudinal component of the output signals shall not exceed the limits shown in Figure 2.

Compliance with Clause 5.5 should be checked by using the methods described in Clauses 6.3.3.
6 TESTING

6.1 Verification of compliance with requirements

Compliance with all mandatory requirements in this AS/CA Standard is to be verified. This may be done by direct measurement, modelling and analysis, operation or inspection.

Methods for demonstrating compliance of CE with the requirements clauses specified in this Standard are described in Clauses 6.2 to 6.3.

Verification of compliance with the referenced standards may be confirmed by test reports to later versions of the referenced standards provided that all clauses of the referenced standards are shown to be met.

Alternative methods of demonstrating compliance to those described may be used if the risk of passing non-compliant CE is not increased because of increased measurement uncertainty.

6.2 Standard test conditions

6.2.1 Unless this Standard provides otherwise, testing for compliance with this Standard should be conducted at the nominal supply voltage of the CE and within the following ranges of atmospheric conditions:

(a) An ambient temperature in the range of 15°C to 25°C inclusive.
(b) A relative humidity in the range of 45% to 75% inclusive.
(c) An air pressure in the range of 86 kPa to 106 kPa inclusive.

6.2.2 Where elements in a test configuration are variable, the test should be carried out over the indicated range for that element.

6.2.3 Unless indicated elsewhere within this Standard:

(a) The accuracy level of all measurements should be better than ±2% for voltage and current, ±0.25% for frequency and ±0.5% for time; and
(b) The tolerance of the nominal 48 V d.c. test source should be ±0.5 V.

6.2.4 Unless indicated elsewhere within this Standard for an individual test, all component values in the test configuration should have a tolerance of:

(a) ±1% for resistance;
(b) ±1% for capacitance; and
(c) −0%, +25% for inductors.
6.3 Parameters to be tested

6.3.1 External Stimulus

6.3.1.1 The requirements specified in Clause 5 should be met in the normal operating modes of the CE unless as otherwise specified.

6.3.1.2 In some CE the power level presented to line is dependent on excitation either internal or external to the equipment. This excitation may be determined from the appropriate product specification or with some CE this will require the connection of the associated CE to provide the stimulus.

6.3.1.3 Compliance with Clause 5 should be checked by performing this excitation then measuring the line signal as described by the appropriate tests.

6.3.1.4 Methods for external stimulus and excitation of the CE include the following:

(a) If the CE includes a voice frequency recording and reproducing element in which the signal recording is achieved either by the user or from signals injected into the recording element from the network, the supplier should provide documentation for the user describing how the power levels of signals transmitted to the network are controlled.

(b) If the signal level control is achieved by means of limiters, this should be checked by injecting voice frequency signals, where indicated in the documentation, at any level necessary to test that the limiters are restricting the signals to the network to the specified required limits.

(c) If the CE generates a modulated VF signal in response to an external stimulus initiated by the user, the supplier should provide documentation for the user describing the operating conditions and any associated signal generating devices.

6.3.2 Impulse measurement

6.3.2.1 Impulses caused by the reversal of DC signals described in Clause 5.1 can be measured with a standard impulse counter set having a high impedance (greater than 100 kΩ // 30 pF) bridged across the line.

6.3.2.2 Figure 3 shows the test configuration. Figure 4 shows the approximate representation of an exchange termination and Figure 5 shows the circuit diagram of a filter which meets the requirements of ITU-T Rec. O.71 [9].

6.3.3 Longitudinal power measurement

The CE under test should be connected to the measuring instrument as shown in Figure 6. A selective measuring set or spectrum analyser having an effective bandwidth sufficiently narrow to measure individual spectral components should be used to explore the frequency band from 200 Hz to 30.175 MHz and to measure the RMS
voltage (V) of any spectral component either using the internal
calibration or from comparison with a sinusoidal signal of known
RMS voltage and the same frequency.

6.3.4  VF signal level measurement

6.3.4.1 Signal levels and frequencies should be measured using a selective
level meter or spectrum analyser with appropriate input dynamic
range and frequency range. Power levels specified in Clauses 5.3,
5.4 and 5.5 should be determined as $V^2/R$, the voltage level being
measured with a high impedance RMS voltmeter bridged across R,
the termination resistor (nominally 600 Ω unless otherwise specified).

6.3.4.2 For the one-minute mean power level measurements, the voltmeter
should have the following elements:

(a) An input band-selection filter with passband 300 Hz to 3.4 kHz.

(b) A square-law detector having a time constant of nominally
100 ms.

(c) An averaging circuit that performs a continuing averaging
process over a period of one minute, i.e. computes the value of:

$$\frac{1}{60} \int_{T_n}^{T_n+60} V^2 \, dt$$

where:  $T_n$ is time in seconds
V is the RMS voltage indicated by the square-law detector, in volts.

The measurement should be carried out for a sufficient time for the
averaging circuit to record a steady value.

Note: In practice, when measuring telephone speech or sustained signals
from modems it may be convenient to observe the indication of the
square-law detector and then to calculate the one-minute mean
value.

6.3.4.3 For determining the measurement of peak-to-peak voltage required
by Clause 5, a storage oscilloscope with a minimum bandwidth of
DC to 30.175 MHz should be used.

6.3.4.4 Power Spectral Density should be measured using the following:

(a) A 10 kHz noise power bandwidth for frequencies between
3.4 kHz and 30.175 MHz.

(b) A 1 MHz noise power bandwidth for frequencies between
300 kHz and 30.175 MHz as described in Clause 5.4.2.

6.3.4.5 Psophometric voltage measurements.

(a) Measurement of the psophometric content of signals for
Clause 5.2 (d)(i) should be performed using a psophometer in
accordance with ITU-T Rec. O.41 [8] set to the weighted, 600 Ω
terminated mode.
(b) Measurement of the psophometric content of signals for Clause 5.2 (d)(ii) should be performed using a psophometer in accordance with ITU-T Rec. O.41 [8] set in turn to:

i. the weighted, unterminated mode; and

ii. the weighted, unterminated mode but with an external termination of 1 μF in series with 4 kΩ.

Note: Suitable blocking capacitors may be necessary in the test configuration to prevent DC flowing through the psophometer.

6.3.4.6 The level of speech or music as required by Clause 5.3.3 should be measured using a VU meter with characteristics in accordance with AS/CA S004 [4] Appendix A.

Simulated exchange with termination (unbalanced representation)

Note 1: Typical Circuit As shown in Figure 6.
Note 2: Typical Filter Circuit As shown in Figure 7.
Note 3: All measurements to accuracy better than:
   ± 2% voltage and current,
   ± 0.5% time,
   ± 0.25% frequency,
   ± 0.2 dB power level.
Figure 5
Filter to approximate ITU-T Rec. O.71 [9]

Figure 6
Test circuit for measurement of longitudinal power level

Note 1: If the equipment has separate protective and signal earth terminals they are connected together.

Note 2: The two resistors R1 are to be matched to within 0.01%.

Note 3: The measuring instrument is of high impedance, and capable of measuring over the frequency range 200 Hz to 30.175 MHz.

Note 4: The measuring instrument is calibrated in dBm as if it was measuring across a resistive load.

Note 5: The adequacy of the balance is checked by repeating measurements with appropriate connection reversal, or equipment disconnection.
Note 6: The value of the resistors R1 and R2 are to be 300 Ω for CE signals with fundamental frequency components in the DC to 20 kHz range.

Note 7: The value of the resistors R1 and R2 are to be 70 Ω for CE signals with fundamental frequency components in the 3.4 kHz to 30.175 MHz range when the CE is not being tested with any associated equipment.

Note 8: This figure does not show DC coupling, if required, of the test loads. This must be carefully considered to ensure correct longitudinal power level measurements and correct operation of the CE.
APPENDIX

A  EQUIPMENT CLASS 3a

Table A1 provides the Group B test criteria and referenced documents for Equipment Class 3a.

The test termination impedance for Equipment Class 3a is TN12 or 600 Ω as appropriate.

Technologies to which Class 3a applies are analogue PSTN lines or voiceband leased lines for which:

(a)  all signalling is confined to either DC to 3.4 kHz or 300 Hz to 3.4 kHz; and,

(b)  does not use any earth referenced signalling such as E&M or longitudinal AC or DC.

Examples of services using CE within this Equipment Class are PSTN POTS without Customer Loop Metering, PSTN LoopIn/Indial lines, voiceband leased lines using dry circuits.

These are compatible with (may be deployed on the same line as) ADSL/VDSL.

</table>

Note 1: PSD requirements for Equipment Class 3a are contained in AS/CA S002 [3], AS/ACIF S006 [5] and this Standard.

Note 2: Refer to Figure 1 for a representation of the PSD.

Note 3: Below 300 kHz the peak PSD shall be measured with a 100 Hz resolution bandwidth. Above 300 kHz the peak PSD shall be measured with a 10 kHz resolution bandwidth.
APPENDIX

B EQUIPMENT CLASS 3b

Table B1 provides the Group B test criteria and referenced documents for Equipment Class 3b. The test termination impedance for Equipment Class 3b is T112 or 600 Ω or other specified impedances as appropriate.

Technologies to which Class 3b applies are analogue PSTN lines, voiceband or audio leased lines for which:

(a) all signalling is confined to the range DC to 20 kHz;
(b) may use earth referenced signalling such as E&M or longitudinal AC or DC;
(c) may use outband signals above the voiceband.

Examples of services using CE within this Equipment Class are PSTN POTS with Customer Loop Metering, PSTN/centrex phone lines, voiceband leased lines using E&M signalling.

These services are incompatible with services using CE in Equipment Classes 6a to 6h, 10a to 10n and 10v in AS/CA S043.2 [7] (i.e. not to be used on the same line as ADSL and VDSL).

This Working Committee was chaired by Peter Cooke. James Duck of Communications Alliance Ltd provided project management support.
Communications Alliance was formed in 2006 to provide a unified voice for the Australian communications industry and to lead it into the next generation of converging networks, technologies and services.

In pursuing its goals, Communications Alliance offers a forum for the industry to make coherent and constructive contributions to policy development and debate.

Communications Alliance seeks to facilitate open, effective and ethical competition between service providers while ensuring efficient, safe operation of networks, the provision of innovative services and the enhancement of consumer outcomes.

It is committed to the achievement of the policy objective of the Telecommunications Act 1997 - the greatest practicable use of industry self-regulation without imposing undue financial and administrative burdens on industry.
